

## IPVideo 9100A Support

I use this device as my video server, it has 4 video inputs, and an audio input. It's has reached EOL status, so I have flashed the YOICS firmware to it. The original firmware supported switching channels with an http get command to fetch different camera images but it was terribly slow, the YOICS firmware support fetching images with an url like !http://192.168.100.8/usr/yoics0.jpg
