

DomotiGa - Todo - # 9

To Do

Since this project is in alpha development state, this list is very dynamic, and is getting bigger every time ...

Wish List

These are the bigger structural things to do:

- ~~Create code to support triggers, actions, events stored inside database (these are now hard coded inside Eventloop module)~~
- ~~Split the standalone program into a server and client part (need to understand how to use the Gambas XMLRPC component for this first)~~
- Support for phone calls stats, voice mail messages (using Asterisk)
- MP3 Jukebox (using MPD, maybe too big to add)
- Build web server support, or the use of separate Gambas cgi module.
- Build better XML rss feed support.
- ~~Setup hosted svn repository, need help with that.~~

- The rest is still on paper or in my head.
